## **Notes**

the data structure used in this code is vector of data type long long, every 9 digits are put in one element of the vector.

Division algorithm is Double Division, the Power function is recursive.

Some quick things I made to optimize the code:

using of add function instead of multiplication in double division, long division by 2 in the power function of  $O(\log n)$ , add function isn't used in multiplication function.

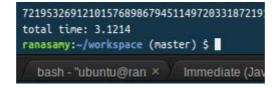

Encrypt Private is the function that takes most of the time, Except this functions all other Functions together run in approximately 1 sec.

All test cases are run on my personal laptop, which slow down the runtime, when example 1 is tested on cloud 9 server, it takes 3.3 sec instead of 5sec.
